

ABSTRACT

The present invention discloses a paintgun sight, which integrates an electronic camera and a liquid crystal display, and has a clamp for easily and quickly mounting the sight above the universal paintball loading inlet. The electronic camera and the liquid crystal display are disposed in front of and behind the paintball loading inlet respectively; the electronic camera captures the image of a target object and displays it on the liquid crystal display. Therefore, unlike the traditional sight, this invention provides a sight for aiming at a target without being blocked by the universal paintball loading inlet.
